6 Comparison between Keylogger detection software and Anti-viruse software

7 Conclusion

Introduction

1. A keylogger is a type of surveillance software (considered to be either software or spyware) that has the capability to record every keystroke you make to a log file, usually encrypted.
2. A keylogger recorder can record instant messages, e-mail, and any information you type at any time using your keyboard.
3. The log file created by the keylogger can then be sent to a specified receiver.
4. Some keylogger programs will also record any e-mail addresses you use and Web site URLsyou visit.

Proposed system

1. A keylogger can be a piece of software that is used to capture the keystrokes that are typed on the keyboard.
2. For a software keylogger, it can be run while being completely invisible and not get noticed by average computer users.
3. They will have to fully depend on security software such as anti-keyloggers or antivirus packages to tell them that a keylogger is present on the system.

Work flow of Keylogger Detection system

Introduction

Proposed system

Working

Advantages

Application

Comparison between Keylogger detection software and

1. Spouses Family Members
2. Employers
3. Private Detectives
4. Law Enforcement
5. Parents Watching Children

Comparison

1. Keylogger detection software can detect keyloggers while anti-virus software does not detect keyloggers.
2. User can see previous status of scanning keylogger processes in our software while it is not possible in other anti-virus software.
3. Malware, viruses, spyware does not detected by our software while other anti-virus software can detect this malware and viruses.

Conclusion

- Software that can not only monitor every keystroke and action performed at a PC but also be used as legally binding evidence of wrong-doing has been unveiled.
- Protect intellectual property and business secrets.
- Prevent and stop sabotage and data theft
- Prevent Internet/email abuse
- Reduce workplace slackers
- Improve efficiency and productivity
